LOOMGROUND

1/7 · THE PROBLEM

Governance should not fragment on the demand side.

Agent capabilities scale on the supply side. Add a second agent from a second provider and your rules are written twice, in two formats.

You can run the same agent everywhere. Your rules cannot follow it easily.

LOOMGROUND

One rule, written six ways.

policy documents
system prompts
workflow code
access settings
model safeguards
approval steps

Each can be checked on its own. None can be checked against another.

LOOMGROUND

3/7 · THE TASK TRAVELS

The task travels. The rule stays where it was written.

```
you → agent A → agent B → tool
```

“Negotiate this contract. Never accept unlimited liability. Ask me before you say yes.” Agent A hands the negotiation to agent B. B receives the contract, the task, perhaps the authority. Nothing carries the two rules from A to B.

API, MCP and A2A carry the task and the data. How to carry the rule easily?

LOOMGROUND

4/7 · THE TEST

An agent cannot hold more authority than its principal.

PRINCIPAL	AGENT ACTING FOR IT	RESULT
level 2	asks level 4	refused

Level: how much an agent may do without asking a person.

This is why the principal gets to set the rules.

LOOMGROUND

5/7 · THE LINE

One line says who decides, and when.

Sending data out at high risk is held for human review:

```
reserve data_transfer by human_review
when risk >= high
```

HELD FOR HUMAN REVIEW

Loomground is the small open language this line is written in. A reviewer reads it as a rule. A program runs it as a decision and keeps a record.

It says who decides. It does not judge whether the risk is high or whether the rule is wise.

LOOMGROUND

6/7 · BRING YOUR OWN GOVERNANCE

Write the rule once. Every agent reads it the same way.

```
today:    provider A → its settings
          provider B → its settings

instead:  you → your rules → A, B, C
```

The rules stay when you change the provider. They go with a task when it is handed on.

A rule between two parties cannot belong to one of them. So the language is open.

LOOMGROUND

7/7 · THE CALL

Open source. Install it, test it, get in touch.

A small side project. The specification, the test cases and two implementations are on GitHub, free to use.
